Findings by Severity

3. Action Plan

Phased Roadmap

4. Data Sources & Methodology

1. Executive Summary

This report presents a comprehensive SEO audit of **solnestai.com** for a **B2B AI implementation agency (service business, STR/real-estate/med-spa vertical focus)** site, generated on August 25, 2026. Findings combine technical, content, schema, performance, visual, and search-readiness evidence as available.

52/100

SEO HEALTH SCORE

Critical Issues Found:

1. **Info:** Six of eight pages declare the homepage as their canonical, instructing Google not to index them
2. **Info:** Five pages share a byte-identical title tag and meta description
3. **Info:** /work carries 2,789 words of portfolio content and is canonicalised away to the homepage
4. **Info:** No page contains a self-contained answer block; longest paragraph on the homepage is 37 words
5. **Info:** Zero percentages and zero dollar figures appear in extractable text across the site

Quick Wins:

1. Set a self-referencing canonical on /about, /services, /work, /book and /webinar
2. Write unique title tags and meta descriptions for those five pages
3. Remove the duplicated brand suffix in the /webinar title
4. Add width and height to the six homepage images missing them
5. Publish real pricing figures as quotable text

2. Audit Categories

2.1 Technical SEO

Score: **40/100**

What Works

- HTTPS enforced, clean 200 responses across all eight sitemap URLs
- robots.txt present, valid, and explicitly permissive to AI search crawlers
- sitemap.xml present and valid at /sitemap.xml with 8 URLs
- meta robots is index, follow with no X-Robots-Tag override

Findings

Six of eight pages canonicalise to the homepage **Critical**

/about, /services, /work, /book and /webinar all emit <link rel="canonical" href="https://solnestai.com">. Verified directly against raw HTML, not through a parser. A canonical pointing at a different URL tells Google the page is a duplicate and should not be indexed in its own right. These are not duplicates: /work alone holds 2,789 words of unique portfolio content.

Recommendation: Emit a self-referencing canonical on every page. /about should declare https://solnestai.com/about, and so on. This is almost certainly one shared layout component hardcoding the site root.

Core Web Vitals could not be measured **Info**

PageSpeed Insights returned a rate-limit error because no API key is configured. No field or lab data was collected, so no CWV claim is made in this report.

Recommendation: Run /solnest-seo:seo google setup to add a free Google API key, then re-run for real CrUX field data.

2.2 On-Page SEO

Score: **38/100**

What Works

- Every page has exactly one H1
- Heading hierarchy is clean, with 24 H3s under 8 H2s on the homepage
- Homepage carries 17 internal links and a coherent structure

Findings

Five pages share an identical title tag and meta description **Critical**

/, /about, /services, /work and /book all use the title "Solnest AI - Watch What Happens When AI Meets Your Business" and the same meta description verbatim. Duplicate titles across a small site are a strong duplicate-content signal and waste the highest-value on-page ranking element on four pages.

Recommendation: Write a unique, intent-matched title and description per page. /services should target the service query, /work the proof query, /about the entity query.

Duplicated brand suffix in the /webinar title **Medium**

The title reads "Live Demo - From Zero to Automated | Solnest AI | Solnest AI", repeating the brand twice. This is the signature of a template appending a suffix to a title that already contains one.

Recommendation: Strip the brand from the page-level title or make the template suffix conditional.

2.3 Content Quality

Score: **55/100**

What Works

- /work is substantial at 2,789 words
- The blog post is a genuine 947-word comparison piece with 4 schema blocks
- Copy is specific about verticals: short-term rentals, real estate, med spas

Findings

Four pages are thin **High**

/book is 52 words, /blog is 59, /about is 292 and /webinar is 317. /about at 292 words is well short of what an entity-establishing page needs, and it is one of the pages AI systems read to decide who a company is.

Recommendation: Prioritise /about and /services. Both are commercially important and both are currently too thin to rank or be cited.

2.4 Schema and Structured Data

Score: **85/100**

What Works

- Organization and ProfessionalService JSON-LD present on every page
- Correct use of @id anchors such as #organization and #service
- Blog post carries 4 schema blocks including article-level markup
- Organization name is byte-identical to every other brand surface

Findings

Schema is duplicated rather than page-specific **Low**

The same Organization and ProfessionalService pair appears on all pages. That is valid and harmless, but page-type schema is missing where it would earn rich results.

Recommendation: Add Service schema on /services and FAQPage where genuine Q&A exists. Note this is a rich-results play, not an AI-citation lever.

2.5 Images

Score: **70/100**

What Works

- Zero missing alt attributes across all 8 pages, which is unusual and good

Findings

Six homepage images lack width and height **Medium**

6 of 9 homepage images declare no intrinsic dimensions, which allows layout shift while they load and harms Cumulative Layout Shift.

Recommendation: Add explicit width and height, or use the Next.js Image component which sets them automatically.

Only one image is lazy-loaded **Low**

1 of 9 homepage images uses loading="lazy".

Recommendation: Lazy-load everything below the fold, keeping the LCP image eager.

2.6 AI Search Readiness

Score: **55/100**

What Works

- All four search crawlers allowed in robots.txt and returning 200 at the CDN edge: OAI-SearchBot (ChatGPT), Claude-SearchBot (Claude), PerplexityBot (Perplexity), Googlebot (Google AI Overviews)
- robots.txt correctly separates search crawlers from training crawlers, which most sites get wrong. OAI-SearchBot and Claude-SearchBot control citation; GPTBot and ClaudeBot are training only; Google-Extended has no effect on AI Overviews
- Snippet-eligible: index, follow with no X-Robots-Tag override
- Brand entity is byte-identical across all 5 machine-readable surfaces: title, og:site_name, jsonld:Organization, jsonld:ProfessionalService, llms.txt
- AI visibility band: Readable

Findings

Five pages are canonicalised to the homepage, blocking AI retrieval **Critical**

Google AI Overviews and AI Mode retrieve from the ordinary Search index. /about, /services, /work, /book and /webinar all declare https://solnestai.com as canonical, so they are not eligible to be retrieved or cited. Verified against raw HTML.

Recommendation: Emit self-referencing canonicals. This is the single highest-leverage fix for both search and AI visibility.

Nothing on the site is quotable **High**

Main-content extraction yields 479 words from 1,921. The longest paragraph is 37 words against a 134 to 167 word target, with zero paragraphs over 40 words. Extractable text contains 0 percentages and 0 dollar figures. A model can read the page and has nothing to lift and attribute.

Recommendation: Add two or three genuine 130 to 160 word answer blocks with real numbers. Published pricing is the most quotable asset available and is absent from extractable text.

Only two of eight homepage H2s are question-form **Medium**

Question-shaped headings match how people phrase prompts and how retrieval segments a page.

Recommendation: Convert several H2s to the questions buyers actually ask.

Citability measurements **Info**

Extraction yields 479 of 1921 words (25%). Longest paragraph 37 words against a 134-167 target. Paragraphs over 40 words: 0. Percentages: 0. Dollar figures: 0. Question-form H2s: 2/8.

Recommendation: Track these on re-audit. They are the concrete measures behind the citability score.

3. Action Plan

Phase 1: Critical Fixes Week 1

- Set self-referencing canonicals on /about, /services, /work, /book, /webinar
- Write unique titles and meta descriptions for those five pages
- Remove the duplicated brand suffix in the /webinar title
- Re-submit sitemap.xml in Search Console and request reindexing

Phase 2: High-Impact Improvements Weeks 2-3

- Expand /about and /services past thin-content thresholds
- Add two or three 130 to 160 word quotable answer blocks with real numbers
- Publish actual pricing as extractable text
- Add width and height to the six homepage images missing them

Phase 3: Content and Authority Month 2

- Convert key H2s to question form
- Add Service schema on /services
- Pursue earned media and third-party mentions, which drive 84% of AI citations
- Build out the blog, which currently holds one post

Phase 4: Monitoring and Iteration Ongoing

- Capture a drift baseline so deploys can be diffed
- Add a Google API key for real CrUX field data
- Re-run the AEO audit monthly against a fixed prompt set and track the trend

Data Sources & Methodology

Source	Description	Update Frequency
PageSpeed Insights API	Lighthouse lab audit (mobile emulation, Moto G Power, slow 4G)	Real-time
Chrome UX Report (CrUX)	28-day rolling field data from real Chrome users	Daily ~04:00 UTC
CrUX History API	25-week p75 trend data per metric	Weekly
Google Search Console	Search Analytics (clicks, impressions, CTR, position)	2-3 day lag
URL Inspection API	Per-URL index status, coverage state, crawl info	Real-time (2,000/day)
